

# NARROW

(9" Max Abduction Width)

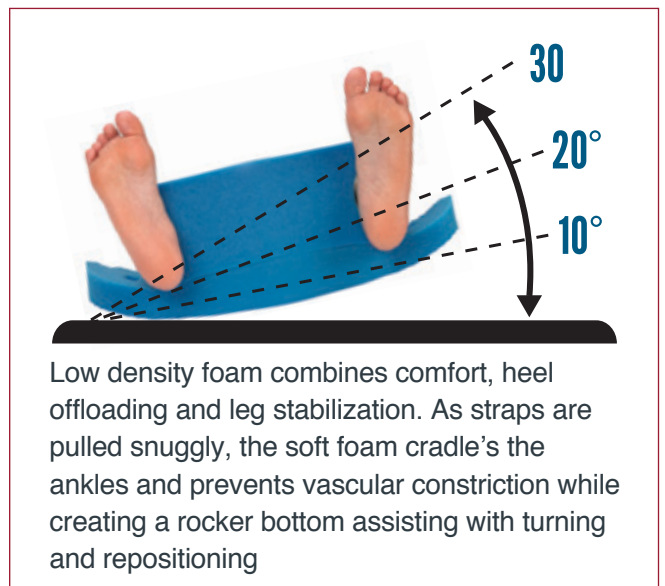

## The *NEW* INOPERABLE HIP SUPPORT

Indicated for  
Non-Surgical  
Hip Stabilization

Latex Free/ Hypoallergenic

Although surgery is typically the best method of treatment for hip fractures, some indications for the non-surgical options are:

- Patients who present late with a fracture that has begun to heal or are moribund
- Lack prospects for any functional recovery and inability to reach post op rehabilitation goals, including Alzheimer patients
- Those who simply refuse surgery
- Patients with an operative risk, many of whom have multiple comorbidities that may place them at elevated risk for postoperative complications

Low density foam combines comfort, heel offloading and leg stabilization. As straps are pulled snugly, the soft foam cradle's the ankles and prevents vascular constriction while creating a rocker bottom assisting with turning and repositioning

**Benefits of Heel-A-Hip Narrow for the non-surgical hip patient: Clinicians on palliative care and hospice care units can feel confident their patients legs are aligned and supported when supine and when being turned.**
